Case Study 1

C:\.....\wwwroot\cust with the file paths stored in the Customers.Picture column. Delete any image file that exists in the folder but is not referenced by any record in the Customers table. This will remove unused customer images from the application.

*The objective is to identify and delete any image files that exist in the **wwwroot\cust** directory but are **not referenced** by the **Customers.Picture** column. These unreferenced files are considered unused and can be safely removed to free up storage space.*

Solution

► Run PowerShell script in Ms Power Automate

The screenshot displays the Microsoft Power Automate web interface. The top navigation bar is blue with the text 'Power Automate | Images remove'. Below the navigation bar, there are tabs for 'Debug', 'Tools', 'View', and 'Help'. The main workspace shows a flow named 'Images remove' with a single step, 'Run PowerShell script', which is highlighted with a blue border. The step description reads 'Run PowerShell script and store its output into PowershellOutput'. To the right of the main workspace, there is a 'Variables' panel. It features a search bar, a 'Global' button (selected), and a 'Local' button. Below these, there are three sections: 'Input' with a count of 0, 'Output' with a count of 0, and 'Flow' with a count of 1. The 'Flow' section contains a variable named 'PowershellOut...' with a value of 'Loading images fr...'.
